

Listing of Claims

The following listing of claims will replace all prior versions, and listings, of claims in the subject application:

Claims 1-20 (canceled).

21. (currently amended) A rewritable phase-change optical recording medium, said recording medium essentially consisting of Ag, In, Sb and Te, and being initialized at least by irradiating said recording medium with a scanning beam spot emitted from a high power semiconductor laser device, wherein an energy density input by said beam spot is ~~equal to, or less than,~~ in a range of 600 J/m² to 1000 J/m².

Claims 22-23 (canceled).

24. (previously presented) A rewritable phase-change optical recording medium as claimed in claim 21,

wherein a scanning speed of said beam spot is in a range of 3.5 m/sec to 6.5 m/sec.

Claims 25-26 (canceled).

27. (previously presented) A rewritable phase-change optical recording medium as claimed in claim 21,

wherein an intensity of the emission from said semiconductor laser device is equal to, or greater than, 330 mW.

Claims 28-29 (canceled).

30. (previously presented) A rewritable phase-change optical recording medium as claimed in claim 21,

wherein a width of an overlapped portion, which is formed as an overlap of irradiated portions of two neighboring irradiation tracks on said recording medium during two consecutive rotations of said recording medium in initializing steps, is equal to, or less than, $0.5 W_r$, where W_r is a width at half maximum of a spatial laser power distribution in a direction perpendicular to a beam scanning direction.

Claims 31-32 (canceled).

33. (previously presented) A rewritable phase-change optical recording medium as claimed in claim 21,

wherein an energy density input by said beam spot during one period of through scan is equal to, or greater than, 600 J/m^2 .

Claims 34-35 (canceled).

36. (previously presented) A rewritable phase-change optical recording medium as claimed in claim 33,

wherein a scanning speed of said beam spot is in a range of 3.5 m/sec to 6.5 m/sec.

Claims 37-38 (canceled).

39. (previously presented) A rewritable phase-change optical recording medium as claimed in claim 33,

wherein an intensity of the emission from said semiconductor laser device is equal to, or greater than, 330 mW.

Claims 40-41 (canceled).

42. (previously presented) A rewritable phase-change optical recording medium as claimed in claim 33,

wherein a width of an overlapped portion, which is formed as an overlap of irradiated portions of two neighboring irradiation tracks on said recording medium during two consecutive rotations of said recording medium in initializing steps, is equal to, or less than, $0.5 W_r$, where W_r is a width at half maximum of a spatial laser power distribution in a direction perpendicular a scanning direction.

Claim 43 (canceled).

44. (currently amended) A phase-change optical recording medium comprising a recording layer, wherein said recording layer contains information recorded in advance therein corresponding to S and R values for selecting an optimum recording power, said S and R values being specified by a method comprising the steps of:

writing a series of information data, as test recording runs, with recording power of laser

beam consecutively varied in a range of 15 mW to 18 mW to thereby generate a recorded pattern including low and high reflective portions;

reading out signals from said low and high reflective portions on said recording medium to obtain recorded signal amplitude, m , corresponding to said recording power, P ;

calculating a normalized gradient, $g(P)$, using an equation,

$$g(P) = (m/\Delta m)/(P/\Delta P),$$

where ΔP is an infinitesimal change in the vicinity of P , and Δm is an infinitesimal change in the vicinity of m ;

determining an optimum recording power, after judging adequacy of the magnitude of said recording power based on thus calculated normalized gradient, $g(P)$;

selecting a specific number, S , from the numbers in the range of 0.2 to 2.0 based on said calculated normalized gradient, $g(P)$;

obtaining a value of said recording power, P_s , which coincide with said specific number, S , presently selected;

selecting a specific number, R , based on the obtained recording power, P_s , from the numbers in the range of 1.0 to 1.7, ~~and~~

~~multiplying wherein~~ said recording power, P_s , ~~is multiplied~~ by said specific number, R , to obtain an optimum recording power value, P_0 .

45. (original) The phase-change optical recording medium according to claim 44, wherein $1.2 \leq S \leq 1.4$, and $1.1 \leq R \leq 1.3$.

46. (original) The phase-change optical recording medium according to claim 44, wherein said recording medium is recordable at a recording velocity ranging from 4.8 m/sec to

14.0 m/sec.

47. (currently amended) A phase-change optical recording medium comprising a recording layer, wherein said recording layer contains information regarding a P_t value recorded in advance therein, said P_t value corresponding to an optimum recording power, P_0 , specified by a method comprising the steps of:

writing a series of information data, as test recording runs, with recording power of laser beam consecutively varied in a range of 15 mW to 18 mW to thereby generate a recorded pattern including low and high reflective portions;

reading out signals from said low and high reflective portions on said recording medium to obtain recorded signal amplitude, m , corresponding to said recording power, P ;

calculating a normalized gradient, $g(P)$, using an equation,

$$g(P) = (m/\Delta m)/(P/\Delta P),$$

where ΔP is an infinitesimal change in the vicinity of P , and Δm is an infinitesimal change in the vicinity of m ;

determining an optimum recording power, after judging adequacy of the magnitude of said recording power based on thus calculated normalized gradient, $g(P)$;

selecting a specific number, S , from the numbers in the range of 0.2 to 2.0 based on said calculated normalized gradient, $g(P)$;

obtaining a value of said recording power, P_s , which coincide with said specific number, S , presently selected;

selecting a specific number, R , based on the obtained recording power, P_s , from the numbers in the range of 1.0 to 1.7; and

multiplying said recording power, P_s , by said specific number, R , to obtain ~~an~~ said P_t

value corresponding to said optimum recording power, P_0 .

48. (original) The phase-change optical recording medium according to claim 47, wherein said recording medium is recordable at a recording velocity ranging from 4.8 m/sec to 14.0 m/sec.

49. (new) A rewritable phase-change optical recording medium as claimed in claim 21, wherein a 3T land jitter of the initialized optical recording medium after 1000 cycles of direct overwrite is equal to or below 35 nsec.

50. (new) A rewritable phase-change optical recording medium as claimed in claim 21, wherein a 3T land jitter of the initialized optical recording medium is equal to or below 35 nsec.

51. (new) An optical recording medium comprising a recording layer containing at least materials capable of carrying out read/write/erase operations through phase changes of said materials therein,

wherein said recording layer essentially consists of Ag, In, Sb, Te and Ge, with a proportion in atomic percent of a(Ag): b(In): c(Sb): d(Te): e(Ge), with $0.1 \leq a \leq 7$, $2 \leq b \leq 10$, $64 \leq c \leq 92$, $5 \leq d \leq 26$ and $0.3 \leq e \leq 3$, provided that $a + b + c + d + e \geq 97$.

52. (new) The optical recording medium according to claim 51, wherein said recording layer has a composition satisfying a relation of $88 \leq c + d \leq 98$.

53. (new) The optical recording medium of claim 51, further comprising a substrate, and

contiguous layers formed on said substrate in order as follows, a first dielectric layer, the recording layer, a second dielectric layer, a metal/alloy layer, and an ultraviolet light curing resinous layer.

54. (new) The optical recording medium according to claim 53,
wherein said first dielectric layer, recording layer, second dielectric layer and metal/alloy layer are each formed having a thickness ranging from 30 nm to 220 nm, 10 nm to 25 nm, 10 nm to 50 nm, and 70 nm to 250 nm, respectively.

55. (new) The optical recording medium according to claim 54,
wherein said metal layer essentially consists of Al and at least one kind of additive with a content ranging from 0.3 weight percent to 2.5 weight percent, said additive being selected from the group consisting of Ta, Ti, Cr and Si.

56. (new) The optical recording medium according to claim 54,
wherein said metal/alloy layer essentially consists of Ag and at least one kind of additive with a content ranging from 0 to 4 weight percent, said additive being selected from the group consisting of Au, Pt, Pd, Ru, Ti and Cu.

57. (new) The optical recording medium according to claim 53,
wherein said recording medium is rewritable at least once at a linear recording velocity ranging from 9 m/sec to 30 m/sec.
